

GEROTTO

Gerotto: the meeting point between construction, technology and robotics.

The Italian company Gerotto Federico Srl, which was among the first manufacturers of industrial robots, has been working and investing for over 20 years in Research & Development to identify and propose technological solutions that could meet the increasingly strict requirements of industrial plants maintenance.

Experience IS innovation

The company has been developing solutions to make cleaning, reclamation and excavation operations more efficient, safer and more productive in construction sites, industries and infrastructures, in Italy and around the world. Thanks to three Business Units (Construction and Contracting Division, Suction Excavators distributor for Italian market and the production of Robotic Cleaning Systems) the company has always been at the forefront of offering high adding-value technologies and specific skills to operate in complex situations.

Problem solving approach

The three business units cooperate with each other: the contracting department is the first user of the technologies that Gerotto designs, produces and sells. This leads to develop a consultancy and a problem solving approach.

The Gerotto's robotic technology development

Developed since the early 2000s, Gerotto's range of robots has grown over time thanks to a proactive approach to the market: the ability to work in close contact with customers and operators has allowed the company to always develop innovative solutions, designed to respond to new operational needs, created to meet new challenges and to provide development opportunities for the market.

Versatility at work

The Lombrico series (born in 2002), compact and powerful, is ideal for cleaning basins, pipes, tanks and confined spaces, even at risk of explosion (ATEX); The Bull and Mini Bull series, designed in 2019, to work in underwater environments for removing sediment and sludge inside tanks; the Dozer is the specific model for cleaning under conveyor belts; the Easy Dozer is the mini wheeled loader suitable for removing debris and rubble in construction sites and tanks; the Gatto is a mini crawler excavator for removing materials. Finally, the FTC was studied and designed in 2016 specifically for cleaning underground fuel tanks using a high-pressure washing system.

IN THE HEART OF INDUSTRY

Since 2002 we have been designing and producing **robotic solutions** that empower contractors and asset owners facing the challenges of the industrial and tank cleaning sector. Our technology is in the heart of industry because it assures **safety, productivity and sustainability** through innovation and digitalization.

Thanks to a versatile **product range of robots, accessories and a consultancy approach**, we develop a go-to technology that fits the requirements of refineries, mines, oil&gas, petrochemical, waste and offshore industries.

You set the goals, we help you achieving them.
